**CANE TESTS PLANTED ON 15th OKTOBER, 2000
FROM JOHN BOOTH'S FARM 6th JUNE, 2001
TYPE Q156 SPRING PLANT AT 8 MONTHS OLD
TRIALS ON CANE Q156 WITH THE BIOACTIVE PLANT
STRENGTHENER**

The BioActive Plant Strengthener was put in water, and the billet was sprayed as it was planted.

John is quite happy with the results, and when John and I carried out a Brix test on a stick of cane from the trial plot on 6th June, 2001, this stick of cane at 8 months old stood 10 feet and about 1 ½" inches through.

John and I did the Brix test in the morning.
The bottom of the cane tested 20% sugar at 10.00 a.m.
At knee high the cane tested 20.5% sugar at 10.00 a.m.
At waist high the cane tested 20.2% sugar at 10.00 a.m.
At head high the cane tested 18% sugar at 10.00 a.m.
At 10 feet the cane tested 11.5% at 10.00 a.m.

Overall, the average sugar content is 18.4% at this stage.

This BioActive Plant Strengthener cane is looking very good. John will be using the BioActive Plant Strengthener in his next planting.

**THE CORRECT PROCEDURE
OF USING BIOACTIVE
PLANT STRENGTHENER
WITH THE BEST RESULTS IS –**
(continued on page 2)

1. BioActive Plant Strengthener is put in the ground 2 weeks before planting. This gives the BioActive Plant Strengthener a chance to prepare the ground for the new cane, by decrystallising the soil and activating all of the nutrients in the soil to make them available for the new cane.
2. By using the BioActive Plant Strengthener in this way, you give the new cane the opportunity to lay down a much-needed greater root system and a deeper root system.
3. It is because the BioActive Plant Strengthener works with the natural energy that is around us, in us and in the ground and in the plant.
4. Because BioActive Plant Strengthener is charged with energy, not a lot is required. 1 kilogram to 1 hectare is quite sufficient for any plant to achieve a much-needed deeper root system.
5. To enhance the growth of cane even further, a second application of BioActive Plant Strengthener is required when the cane is approximately 1 foot in height.
6. However, in new cane, a third application is required when the cane is 3 feet high. However, ratoon cane, requires 2 applications @ 2 week intervals.
7. BioActive Plant Strengthener can be applied through any watering system or boom spray at the rate of 1 kilogram per hectare. If a boom is used, at least 1,600 litres of water per hectare is recommended.
8. If BioActive is used in the right way, you can expect amazing results. We feel that not only the sugar content will be much greater, but also tonnes per hectares would be easily achieved. BioActive Plant Strengthener trialed on all the other vegetable plants used in the correct manner have showed a 3% increase in sugar and a 25% better yield.

BIOACTIV IS A NATURAL PLANT AND SOIL ENHANCER – NOT A FERTILISER OR CHEMICAL
