TOMATO TRIALS

**AT VIC WATT'S FARM / BONNA ROAD, BUNDABERG
TRIAL RESEARCH BY PAUL BRIFFA AND CLEVE WOOD**

5th JUNE, 2001

BIOACTIVE PLANT STRENGTHENER

Good ground with no synthetic fertiliser. Ground was prepared 2 weeks before planting with the BioActive Plant Strengthener, at 1 kilogram to the hectare.

Young seedlings were placed in a BioActive Plant Strengthener water for 4 hours before planting. 1 Tablespoon to 20 litres of water is the solution mix.

60 tomato plants were planted for this trial and were planted late afternoon (better results were achieved by planting at this time of day). Of the 60 plants planted, 56 were very healthy and the next day the water solution which was used to dunk the seedlings in was poured over the 4 sick plants. A week later, the sick plants had caught up to the healthy plants with no noticeable difference. Photographs show plants at six weeks of age.

VicWatts' Smallcrops Farm
Bonna Road, Bundaberg*

The plants grew rapidly and very strong and reached flowering stage at eight and a half weeks. It is now 10 weeks into the trial, the plants are very strong with a surplus of flowers and already bearing tomatoes the size of a large marble.

We found with the tomato plants, the stem was a lot stronger than the tomato plants grown without the BioActive Plant Strengthener and also had a very strong, huge root system.

Tomatoes - 6, 8 and 10 weeks
