Report of experience

After we had received a sample of 2 kg we have tested it and the effect surprised us so that we ordered a bigger amount. In January we received 25 kg and started right away. We composted gardening waste and wet small pieces of wood as well as waste from the slaughterhouse.

When we transposed a compost heap we used the amount of 25 kg BioAktiv-Powder for about 500 cbm raw material. This was, as it showed some times later, overdoses and with light rain the compost reaped nearly flowed away. The composting-procedure which normally takes 12 weeks was completed 6 weeks earlier. The consistency of that finished product was crumbly and more suitable for processing.

At the moment we do a lot of experiments to find out the suitable dosage. We are of the opinion that 5 kg / 100 cbm was much too high. The best dosage might be there around 1 - 3 kg / 100 cbm.

We clearly noticed that the strong smell had reduced. Our staff noticed this with satisfaction.

The compost heaps did not need to be transposed so much as before and therefore the use of heavy appliances was reduced. Exact observations have not been made yet. But this fact is of enormous importance for profitability. We are going to give it our full attention. But up to now we can say that by using BioAktiv-Powder wage hours, costs for energy and time using appliances reduced markedly. The costs of BioAktiv Powder, was repaid several times over.

We are quite sure that with the help of BioAktiv-Powder we are able to compost twice as much raw material as without.
