LETTUCE TRIAL No. 2

**AT VIC WATT'S FARM – BONNA ROAD, BUNDABERG
TRIAL RESEARCH BY PAUL BRIFFA AND CLEVE WOOD**

SECOND ROTATION WITH BIOACTIVE PLANT AND CROP STRENGTHENER

The ground used for this trial had a previous crop of BioActive treated lettuce. To prepare for the follow-up crop, the soil was treated with BioActive straight after the first crop was harvested. The second crop was planted 8 days later.

Before planting, the seedlings were placed and soaked in a BioActive water solution, with a further dose of BioActive Plant Strengthener applied 14 days after sowing. A maintenance dose was applied 14 days later.

The results speak for themselves with lettuces reaching maturity at 7 weeks, as shown in the photographs below.

We are totally sure BioActive used correctly will achieve these outstanding results.

- (1) All of the crop reached maturity at the same time.
- (2) All the seedlings planted were harvested **with no re-plant of seedlings required.**
- (3) Feedback from consumers is very pleasing, commenting that they want the same lettuce the next week because of outstanding flavour and texture.
- (4) Some consumers are travelling up to 20 km to buy these lettuces.
- (5) No diseases on crop were evident, with little grub damage or affect.

CLEANING UP EVERY ASPECT OF THE ENVIRONMENT
