

# BIOAKTIV

## Dissolving deposits in liquid manure basin

**Site:** liquid manure basin of farmer Linhart in Mělnické Vtelno  
max. pond volume 100 m<sup>3</sup>

**Dosage:** 5 kg BioAktiv for liquid manure (per application), dissolved in 1000 litres water

**First application:** 27.5.2013    **Second application:** 25.6.2013    **Control:** 23.7.2013

**Costs:** Total amount 10 kg, price per kg 389 Czech crowns, i.e. **3890 Czech crowns plus VAT for the entire pond**

*Using BioAktiv the deposits in the largely inaccessible pit were dissolved. The product was therefore conveyed via a steel pipe to a position in the pit and was found to have a positive effect, as the enations and deposits were dissolved throughout the entire pond and could then be transported away.*

*The basin for pig and piglet liquid manure had been an unending problem which we were able to solve this year in only two months. Bioaktiv is added to the animal feed for sows, piglets and animals raised for slaughtering in order to improve the state of health and increase the feed conversion ratio and growth rate, while reducing the discharge of ammonia and enabling a more homogeneous liquid manure.*
