

BIOAKTIV

References for use in animal feed and liquid/solid manure

Agropodnik Znojmo, a.s. (AG) –Jezeřany and Strachotice farms

BioAktiv for animal feed and BioAktiv for liquid manure have been used to solve local problems with liquid manure.

First the specified method was applied at the Jezeřany farm with 5,000 fattening pigs. After about a month BioAktiv was found to make the liquid manure in slurry pits and silos at Vítkovice much more homogeneous. There were no more deposits, and pits and dung channels no longer required costly flushing. Slurry properties were then analyzed and found to be excellent. After this positive experience the problem with dung channels at Strachotice was tackled where sows and piglets are kept. When BioAktiv was added, the slurry began to "bubble" again and became homogeneous. BioAktiv was also used on other farms with very good results, saving slurry handling costs and improving the efficiency of these farms. Unfortunately, no objective comparison was possible of the effects on daily weight gain, feed conversion, health status, mortality and other factors which would certainly have shown more economic benefits.
